

Innovate for Smarter Civic Living

MUDDA – AI CoPilot for Smart Governance

Building Intelligent, Responsible Civic Monitoring Systems

Supervisor (s):

- Dr. Shilpa Mahajan

Team Members:

- Saumil Kulshreshtha (22CSU158)
- Shivesh Kumar Dhiman (22CSU164)
 - Shubh Pundir (22CSU165)
 - Vikas Kumar (22CSU190)

Department of Computer Science and Engineering

The Black Hole (Citizen Disconnect)

Tedious reporting on fragmented portals

Zero transparency or tracking

Forced to rant on global platforms where nothing gets fixed

..... The Execution Gap

The Overwhelm (Authority Avalanche)

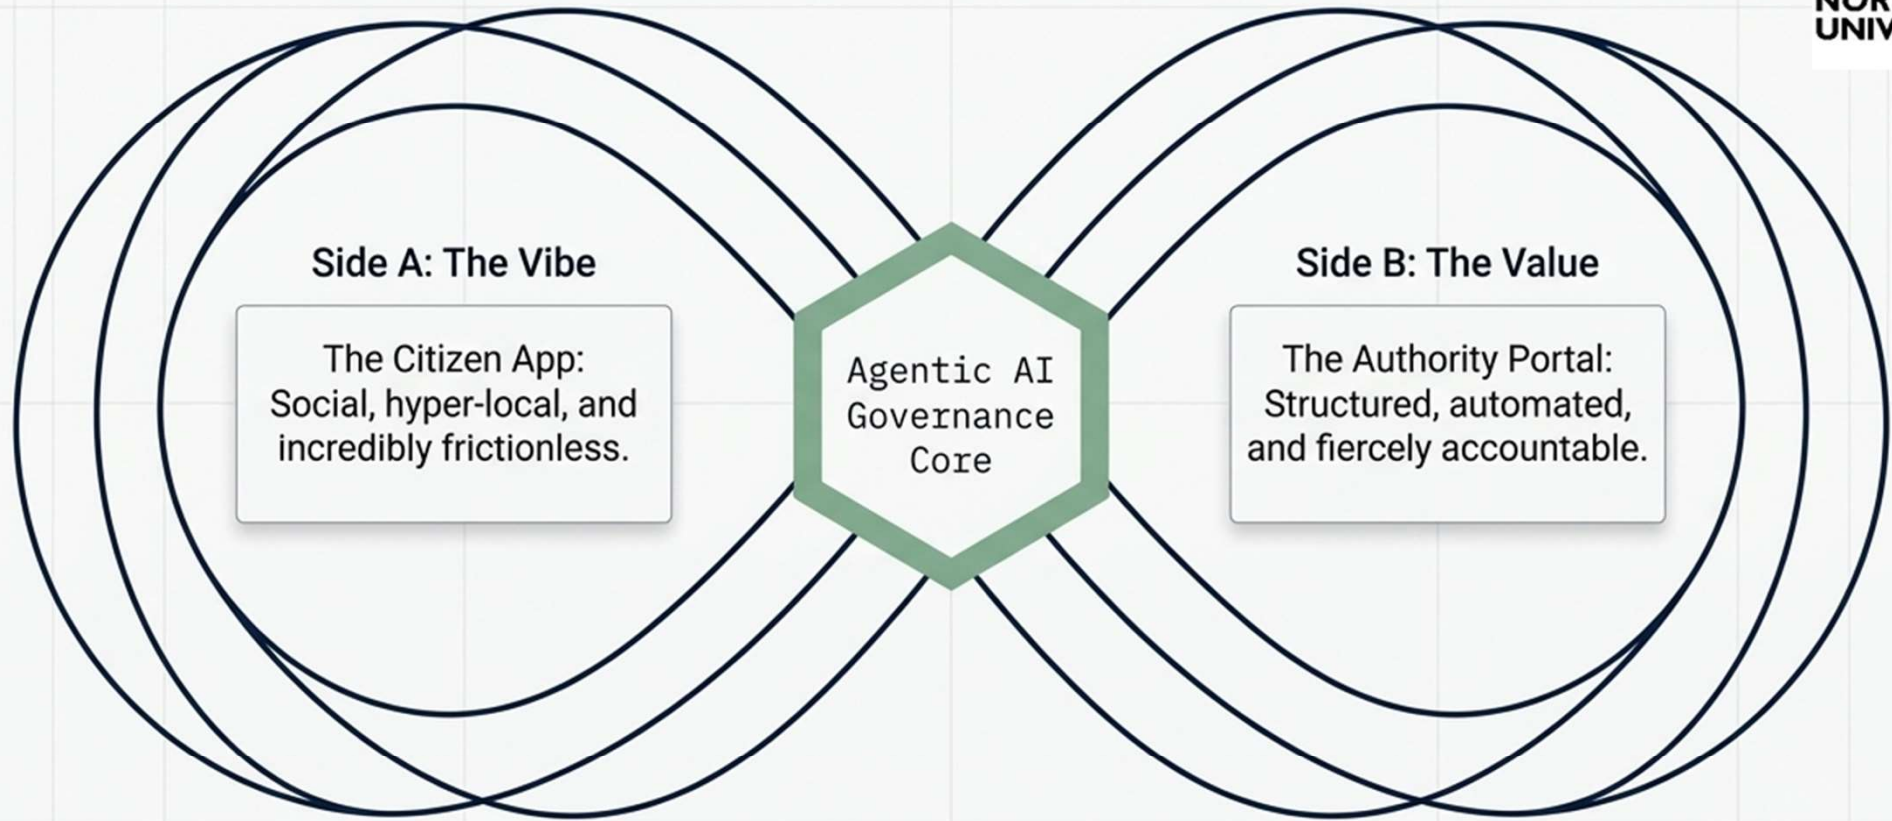

Buried under unstructured complaints from traditional systems

Hours wasted on manual inter-departmental routing

Complete lack of predictive prioritization or data clustering

The engagement of a modern social network perfectly synced with the efficiency of enterprise decision intelligence.

Bridging the Gap: Asymmetrical Benefits for a Unified Ecosystem

Mudda delivers the frictionless transparency citizens demand and the cognitive offloading authorities require.

The Citizen Experience

Empowering the Community

Frictionless Reporting

Residents report issues seamlessly via text, photo, or video in a localized, highly engaging social format.

Total Transparency

Real-time tracking of complaint status and clear mapping of responsible departments mathematically eliminates the "bureaucratic black box."

Community Power

Hyper-local mapping and upvoting mechanics turn isolated complaints into collective civic accountability and community bonding.

The Authority Ecosystem

AI as a Management Co-Pilot

Cognitive Offloading

The agentic AI automatically categorizes incoming reports, scores urgency using BERT-based sentiment analysis, and routes them to the correct department.

Solving the "Redundancy Paradox"

By spatially and semantically clustering hundreds of identical complaints into a single incident, Mudda drastically cuts manual triage time.

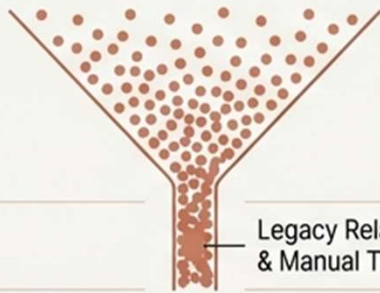

Data-Driven Governance

Live heatmaps and trend analytics transform reactive crisis management into proactive resource allocation and predictive maintenance.

THE BOTTOM LINE: By ending redundant crew dispatches and automating administrative triage, Mudda restores the foundational social contract while significantly cutting municipal management overhead and preventing fiscal waste.

The Intelligence Gap: Market Scale vs. The Triage Crisis

Legacy Relational Databases
& Manual Triage

2.2M+

Unresolved Public Grievances (CPGRAMS 2024-25)

Analog reporting methods and the Integration Hell of siloed municipal platforms have created an administrative black box. The current average disposal time for civic issues sits at a staggering 64 days, choking the system and alienating citizens.

\$317.1M USD

India AI Governance Market Size by 2033 **44% CAGR (2026-2033)**

Driven by the ₹10,372 crore IndiaAI Mission, the transition to sovereign algorithmic governance is inevitable. Capturing this exponential growth requires more than digitizing old workflows; it requires the mathematical elimination of redundant manual effort.

The \$317.1M opportunity cannot be captured by hiring more administrators. It will be captured by platforms that autonomously transmute high-entropy civic noise into structured operational matrices.

The Loop in Action: From Citizen Post to Fixed Pothole

A single, unbroken loop of action combining citizen reporting, AI triaging, and human authorization.

The 'Aha!' Moment: Human Override Handshake

Assistive Analytics,
Not Autonomous Action.

1. AI Drafts

The LLM fetches local policies and drafts a compliant step-by-step resolution plan.

2. Human Approves

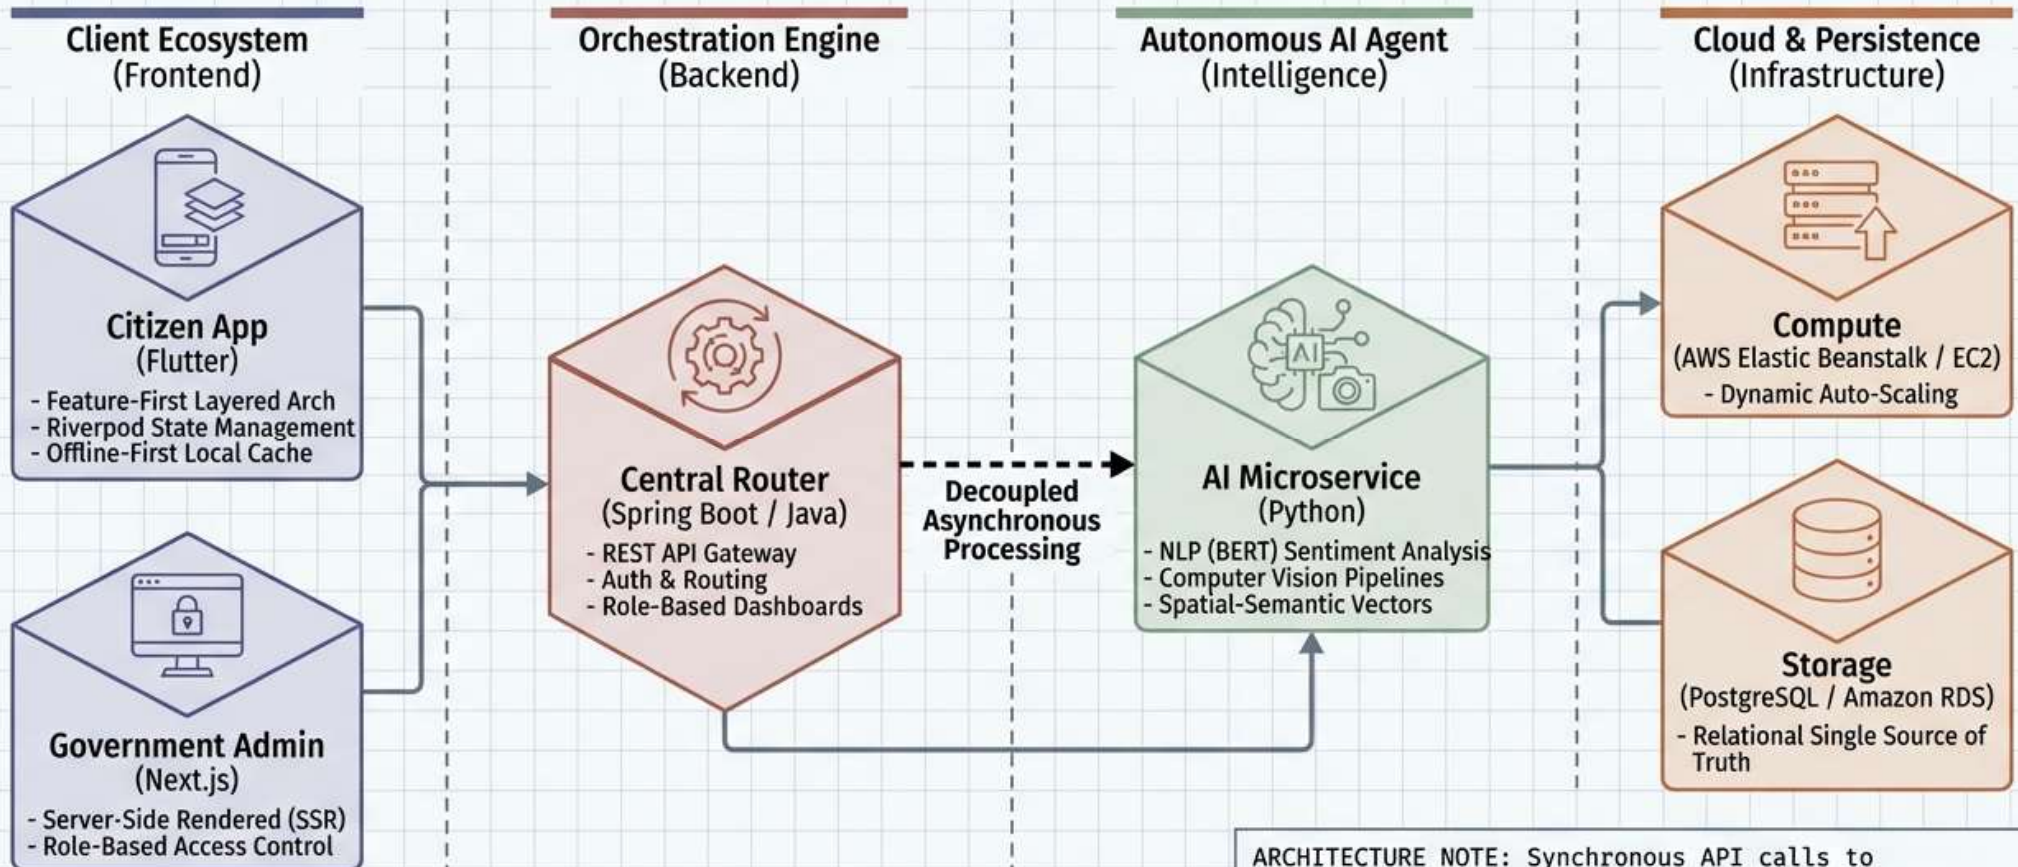

The system completely halts. An authorized human operator reviews the plan and clicks APPROVE.

3. System Executes

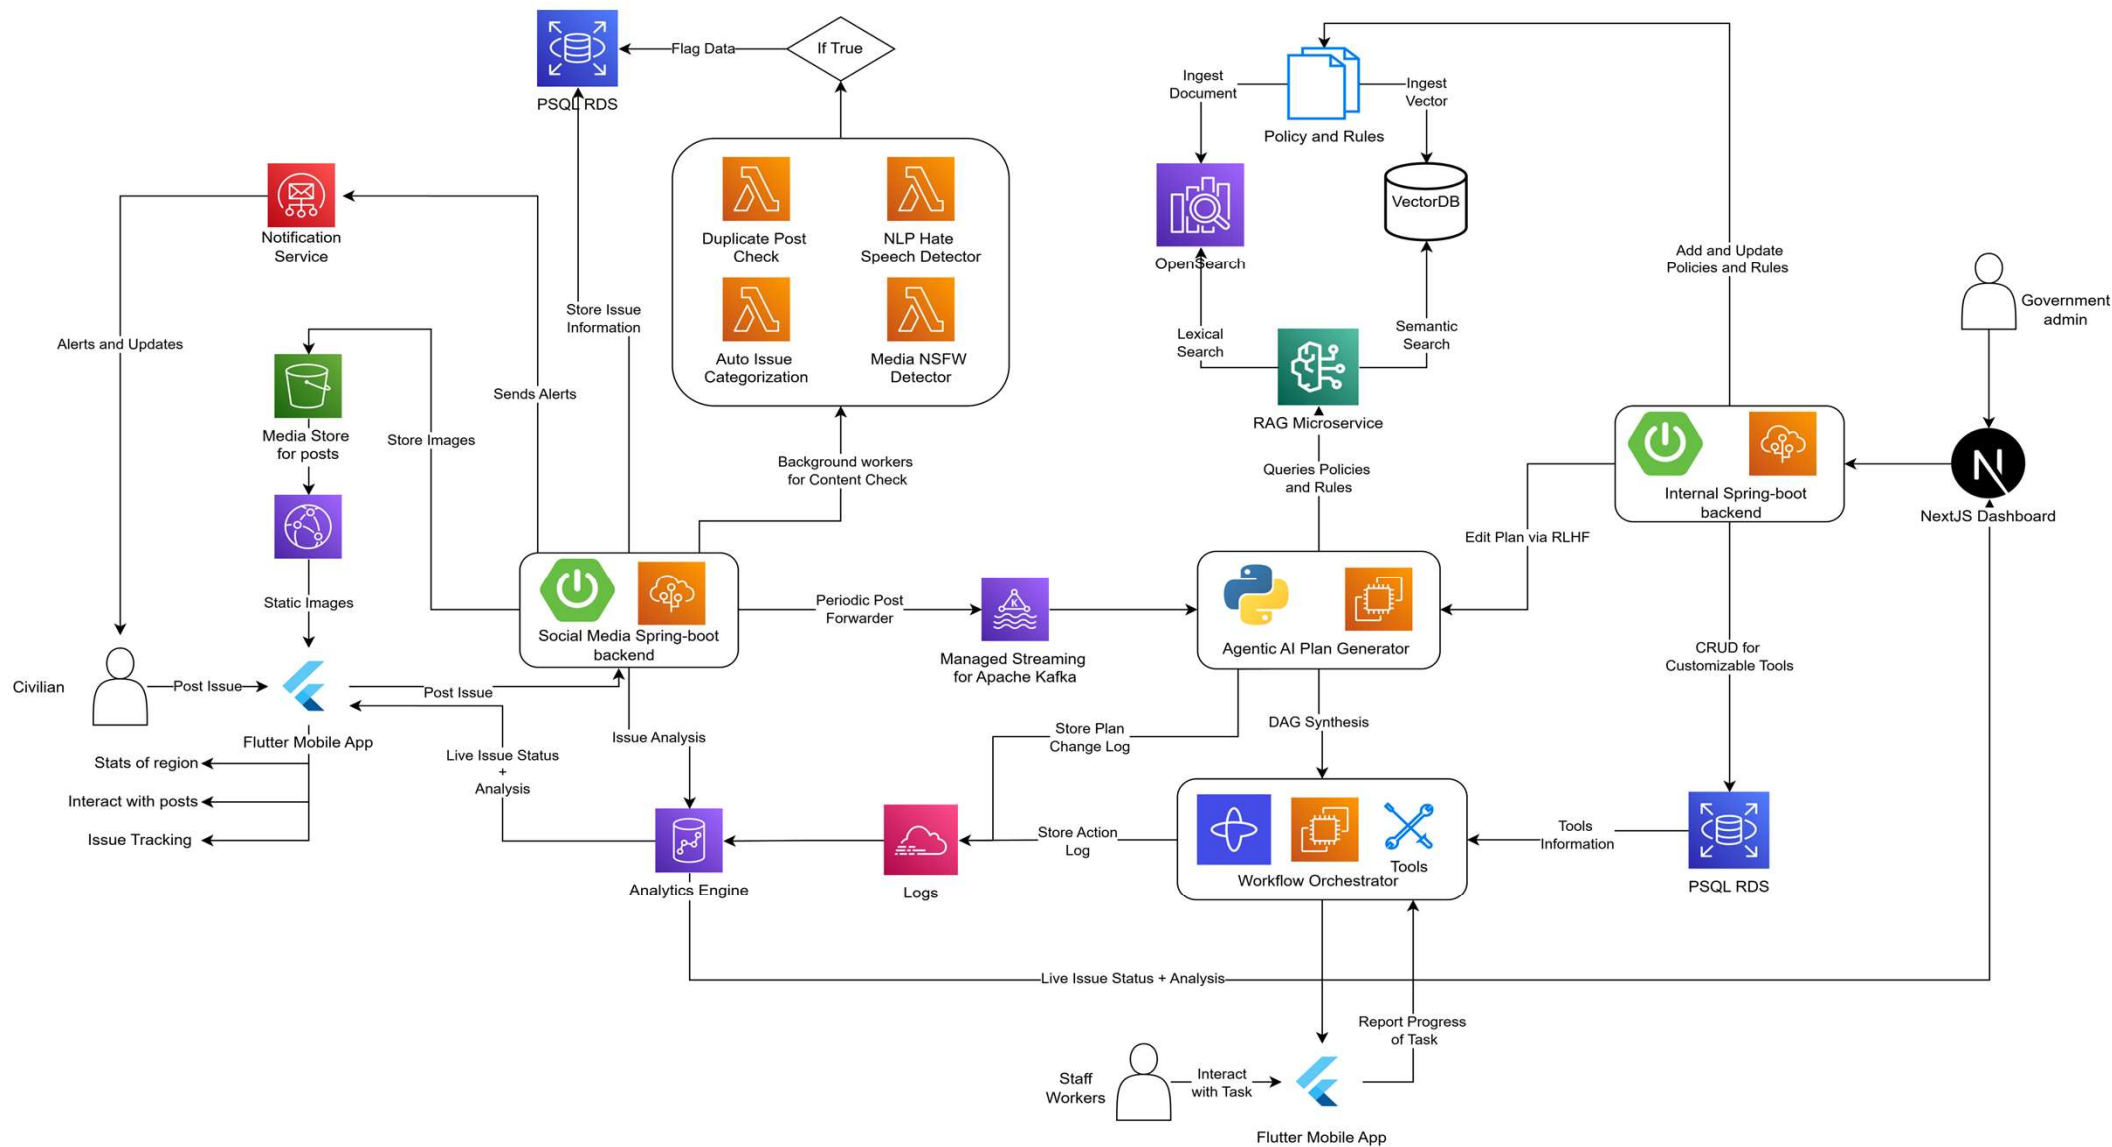

Only after approval does Mudda dispatch ground staff and update the community.

TECHNICAL ARCHITECTURE OVERVIEW

ARCHITECTURE NOTE: Synchronous API calls to computationally expensive AI models cause frontend timeouts. Mudda mitigates this by completely decoupling the Python AI microservice from the main Spring Boot thread, ensuring a seamless user experience while intensive deduplication runs in the background.

Operational Economics and Asymmetric ROI

Preventing just two redundant municipal truck dispatches per month entirely covers the operational server overhead.

	Layer	Est. Cost (INR / Month)
1	Frontend & CDN	₹4,000 – ₹5,500
2	API & Compute	₹10,000 – ₹14,000
3	Database & Cache	₹10,000 – ₹13,000
4	AI Layer (Amazon Bedrock)	₹8,000 – ₹15,000

Total Pilot Cost: ₹30,000 – ₹45,000 / month

ROI Tipping Point:
2 Wasted Dispatches Saved

The Competitive Matrix: Why Legacy Civic Tech Fails

Existing apps act as digital suggestion boxes. Mudda acts as an autonomous command center.

Features	Mudda	MCD 311	Swachhata	Delhi Mitra
Scope	Pan-India	City-Level	Sanitation Only	City-Level
Social Mechanics	✓ Upvotes/Validation	✗	✗	✗
Smart Intelligence	✓ AI Clustering	✗	✗	✗
Transparency	✓ Real-Time Tracking	✗	✗	Limited
Admin Interface	✓ Agentic AI	Manual DB	Manual DB	Manual DB

The India Regulatory Quad: Compliance Architecture

DPDP Act, 2023

Main Data Protection Law

Algorithmic PII obfuscation and data minimization. Identity is structurally decoupled from civic data prior to AI processing.

IT Act, 2000

Cyber Law Backbone

AWS-backed encrypted pipelines and immutable PostgreSQL digital ledgers ensuring forensic auditability and algorithmic transparency.

SPDI Rules, 2011

Sensitive Data Handling

Secure processing of geotags via stringent OAuth protocols, Riverpod state isolation, and encrypted local caching.

IT Rules, 2021

Platform Regulation

Proactive intermediary compliance utilizing Python AI microservices for automated hate speech and misinformation filtering.
